

Restart: Restarts the simulation.

Run all: Runs for full simulation.

Run for 5 us: Only runs upto to mentioned time. For instance in this only runs for 5 us.

Step run: This runs step-by-step as tool executes the code.

Relaunch simulation: relaunches the simulation.

How to debug a design

firstly run the simulation and then **Restart**.

- 1) Initially, use **Step run** to know how your code is being executed by the tool.
- 2) If you are confident that your design is working as expected till 5 us then **Restart** and **Run for 5 us**, then again continue with **Step run**.

Any design can be debug using any of this combinations along with debugging points.
